Company Overview

Bolter Technologies is a Pakistan-based software and technology company headquartered in Islamabad, serving businesses and enterprise clients. Our work spans AI, automation, software development, data analytics, and cybersecurity, with a focus on technology that supports real business and operational needs.

Bolter is a relatively young company, but our senior team brings experience from established businesses and long-running projects. We are a sister company of Sigma Engineering, in business since 2008, giving us a broad business and technical foundation.

Our company is built around a simple idea: technology should make life easier for everyone. We work across numerous fields of technology, helping businesses turn ideas, inefficient processes, and complex data into practical systems that actually work.

AI and business automation

LEAD PRACTICE

Most offices have **a job someone does by hand** every day: copying numbers between two systems, chasing an approval, sending the same report every Monday. We find those jobs, build **software that does them**, and leave people in charge of the decisions that need judgement.

CASE STUDIES THAT FOLLOW

EchoHunt

RetinaScan AI

HOW WE HELP

- 01 Automate repetitive work that takes up your team's time
- 02 Replace manual handoffs between people, spreadsheets, and systems
- 03 Connect the software your business already relies on
- 04 Create custom applications around your team's actual workflows
- 05 Use AI where it can handle work that previously required a person
- 06 Keep the system running, maintained, and supported after it goes live

Current by Logmate

Billing and recovery platform

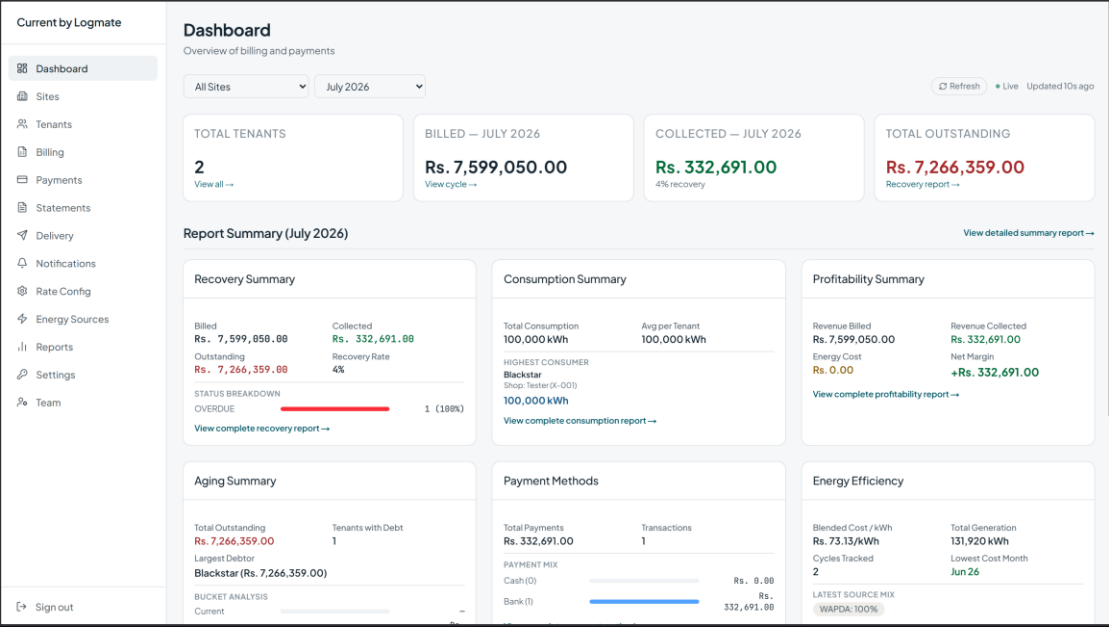

LOGMATE ENGINEERING AND SERVICES • 2026 • 13 WEEKS • ONGOING

THE PROBLEM

Billing electricity accurately for a commercial mall with over 250 tenants across multiple sites is a moving target every single month. Every unit sits on a different consumption tier, every bill has to reach the right tenant through the right channel, and every incoming payment has to be tracked down and matched to the right account before anyone can say who has paid and who has not. On top of that, ownership needs clean recovery and profitability numbers every month.

WHAT CHANGED

The mall runs its entire monthly billing and collections cycle end to end, across every site it operates. Tenants receive accurate, on-time bills through the channels they actually check, overdue accounts are caught and escalated without anyone chasing them, and the business gets ready-to-use recovery and profitability reporting each month instead of assembling it by hand.

250+

tenant accounts billed automatically every month

100%

of bills calculated, generated and delivered without manual entry

~70%

less manual effort spent on billing and reconciliation

24/7

automated bank payment reconciliation

Cortex Strike

Autonomous penetration testing agent

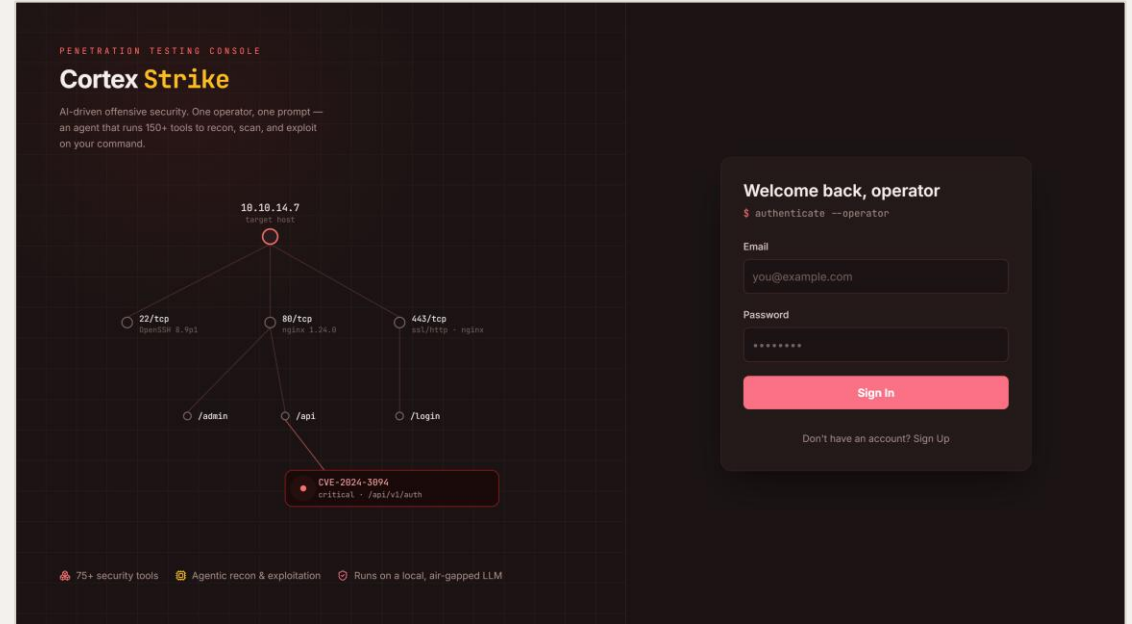

GOVERNMENT AND CRITICAL INFRASTRUCTURE — NAME WITHHELD • 2026 •
1 YEAR • DELIVERED

THE PROBLEM

Running a real penetration test means operating dozens of separate command-line tools by hand — a network scanner here, a web fuzzer there, a credential tester somewhere else — then manually correlating everything each one turns up before a single finding can be written down.

WHAT CHANGED

Operators run full, multi-tool security assessments through a single guided conversation, with the agent actively helping interpret findings, connect signals and steer the assessment as it unfolds. Instead of juggling tools and outputs, the platform turns raw security data into actionable insight while capturing findings, tool output and reports on its own.

90+

security tools an operator can run through one AI-guided conversation

24+ hrs

longest autonomous assessment run without operator intervention

20%

better results than the same tools driven by hand

EchoHunt

Digital discourse monitoring

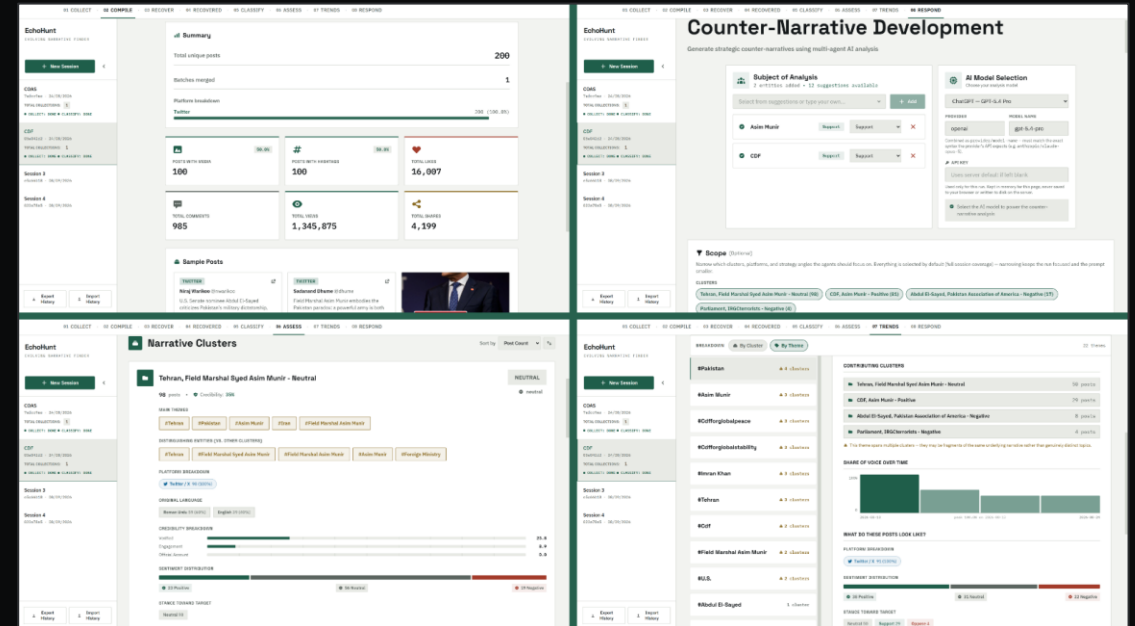

GOVERNMENT AND PUBLIC SECTOR COMMUNICATIONS — NAME WITHHELD • 2025
• 10 MONTHS • DELIVERED

THE PROBLEM

Narratives move fast across social media, and by the time a harmful or misleading story is obvious to a communications team, it has often already spread across multiple platforms and languages. Manually tracking thousands of posts across Twitter, Instagram, YouTube and Facebook — in multiple languages, including text baked into images and spoken in videos — is not something a human team can do at scale or in real time.

WHAT CHANGED

Communications and analyst teams get one workflow in place of hours of manual, multi-platform monitoring: scrape, enrich, detect, review, respond. Instead of discovering a narrative after it has already spread and then starting a response cold, they see narratives ranked by real credibility and influence signals and receive a drafted, platform-specific strategy they can act on immediately.

180,000+

posts collected, enriched and analysed

4

platforms monitored at once — Twitter, Instagram, YouTube, Facebook

100%

of the core pipeline runs on local infrastructure, no cloud required

RetinaScan AI

Explainable diabetic retinopathy screening

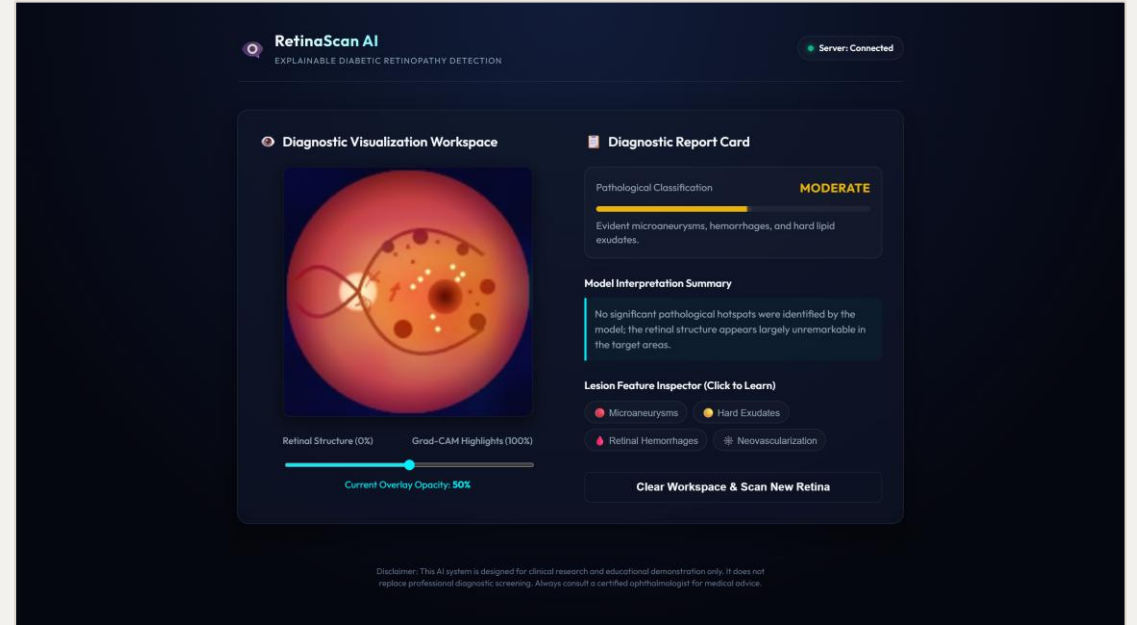

IN-HOUSE PRODUCT • 2026 • 5 MONTHS • DELIVERED

THE PROBLEM

Diabetic retinopathy is one of the leading causes of preventable blindness in working-age adults, and it is entirely manageable when caught early. The problem is catching it. Screening depends on a specialist reading a retinal photo and judging where it falls across five stages of severity, from no disease to sight-threatening proliferative disease.

WHAT CHANGED

An inspectable alternative to black-box DR screening: one photo in, a severity read and a visual, plain-language explanation out. Rather than trusting a single number, a viewer can see which part of the retina drove the classification and what clinical feature it corresponds to — which is the gap between "the model said so" and "here is the evidence."

5

DR severity stages classified per scan,
healthy to proliferative

4

clinical findings flagged and explained per
scan

30,657

labelled fundus images used to train the
diagnostic model

<5s

from image upload to full diagnostic report

Software development

The software a **business actually runs on**: the product its customers use, the internal systems its teams rely on every day, and the spreadsheet that has somehow been holding an entire department together for the last six years. We build the tools that make that work easier, more reliable, and less dependent on someone remembering exactly how everything works.

CASE STUDIES THAT FOLLOW

LTE Trove

PSX Portfolio Tracker

Zenith

HOW WE HELP

- 01 Web applications, customer portals and internal systems
- 02 Replace spreadsheets and manual trackers with something built for the job
- 03 Connect to what you already use: accounting, CRM, payments, email, WhatsApp
- 04 Extend and repair software you already own instead of starting again
- 05 Logins, permissions, payments, notifications and the workflow behind them
- 06 Put it live, watch it, and hand over documentation your team can work from

LTE Trove

Virtual 4G network lab

TELECOMMUNICATIONS — NAME WITHHELD · 2026 · 6 MONTHS · DELIVERED

THE PROBLEM

Testing and validating cellular network protocols traditionally requires dedicated RF testbenches, physical eNodeB base stations, software-defined radios, RF shielding enclosures and programmable USIM cards — tens of thousands of dollars per bench. Physical test rigs create constant contention across engineering teams, introduce hardware misconfigurations that are difficult to isolate, and demand hours of manual wiring and flashing just to test a single core configuration or handover scenario.

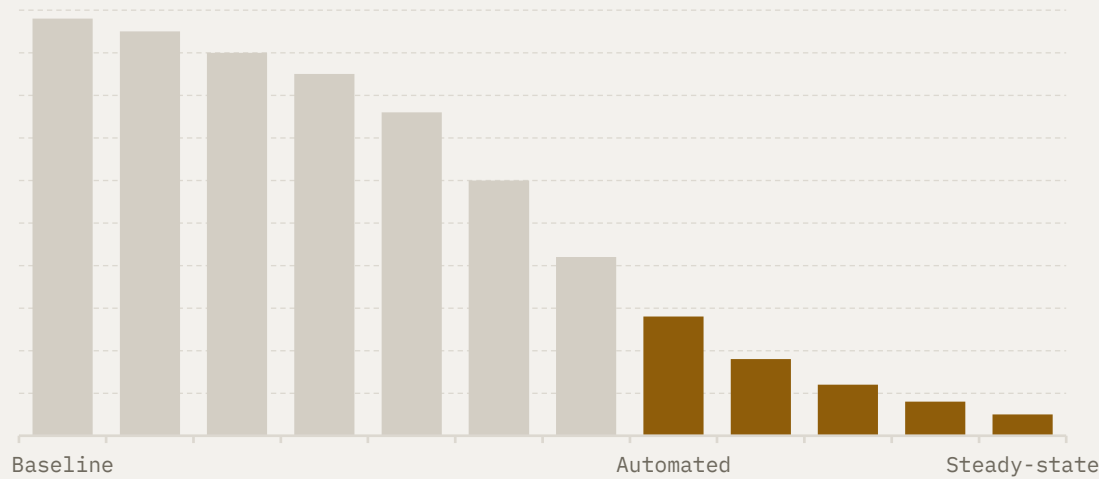

WHAT CHANGED

The dependency on specialised lab hardware is gone: complete, isolated 4G LTE networks now spin up on standard compute workstations and in CI. Protocol engineers configure multi-eNodeB topologies, simulate subscriber authentication, execute X2 handovers and verify end-to-end data session flows through automated suites in minutes rather than days.

LAB SETUP & 3GPP REGRESSION TEST DURATION (HOURS)

98 → 5

-95%

100%

software-defined RF simulation, no physical hardware dependency

< 3 min

to provision and orchestrate a full multi-node virtual EPC and RAN

7

automated 3GPP milestone verification suites, M1 to M7

PSX Portfolio Tracker

Live tracking for the Pakistan Stock Exchange

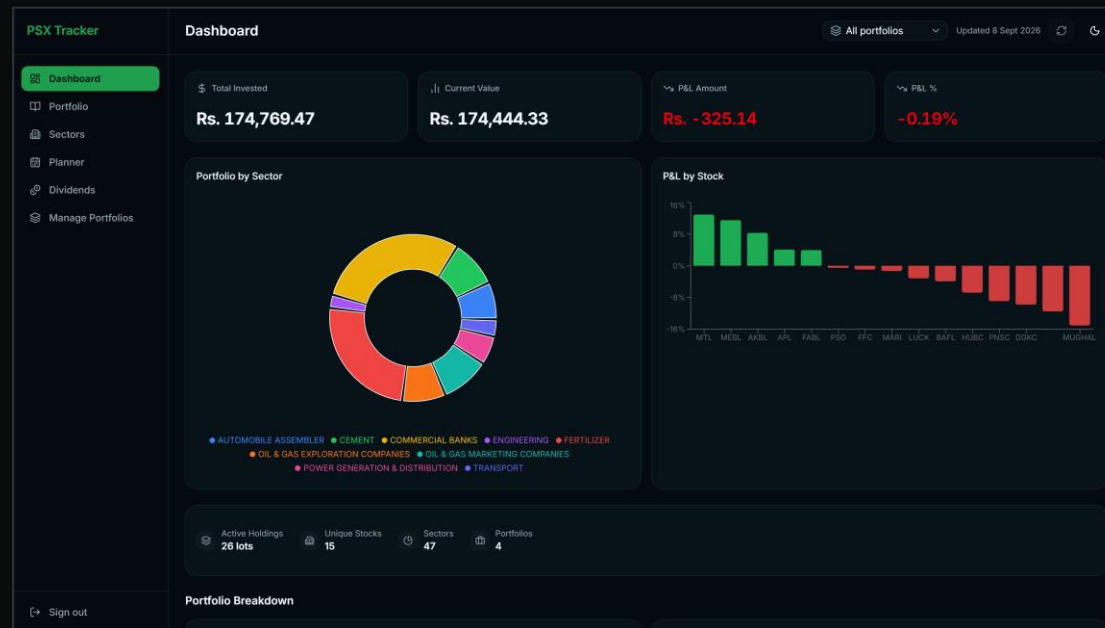

IN-HOUSE PRODUCT • 2026 • 10 WEEKS • LIVE

THE PROBLEM

Tracking a portfolio of Pakistan Stock Exchange holdings usually means working around whatever the broker gives you. Broker platforms are built for placing trades, not for understanding a portfolio afterwards: the record of what was bought, when, and at what price is often thin or hard to find, dividend history is rarely tracked at all, and there is no view of how money is split across sectors or how a stop-loss level compares to where a stock is trading right now.

WHAT CHANGED

Everything that used to mean toggling between a broker app and a stack of old emails now lives in one live dashboard: current holdings and P&L, a real buy and sell history, dividend income, sector allocation against target, and a clear monthly plan for new investment. Stop-loss levels are calculated for every holding without manual math, and drilling into a single stock's full trading history takes one click instead of an inbox search.

700+

PSX-listed stocks tracked with live pricing

15-min

price refresh cycle for near real-time market data

-75%

less manual effort tracking prices, dividends and performance by hand

10x

faster portfolio check-ins than digging through broker records and email

Zenith

A reading platform for serialised web fiction

IN-HOUSE PRODUCT · 2025 · 4 MONTHS · DELIVERED

THE PROBLEM

Readers who follow serialised web fiction end up managing sprawling libraries — hundreds of ongoing titles and tens of thousands of chapters, all on a single ad-heavy site with inconsistent formatting and no way to organise anything. Tracking what has been read, picking back up where you left off, and grouping a library by genre or priority are simply not options there. Nothing treats a personal reading library as a library rather than a stream of individual novels.

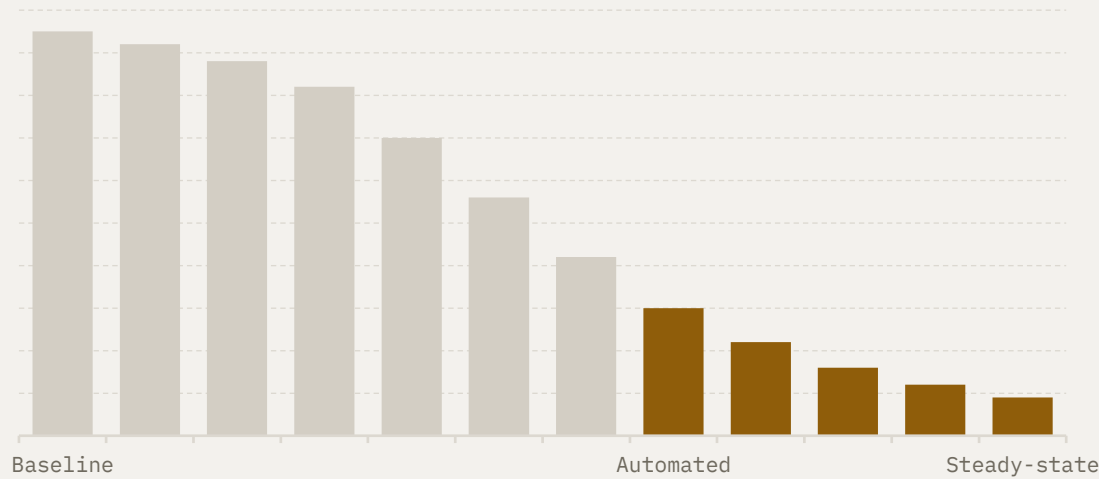

WHAT CHANGED

An entire library in one place: imported in a single step, kept organised with categories and tags, and readable offline in a clean, consistent format with none of the original site's clutter. Library and reading progress carry across the web app and the Android build, with text-to-speech built in for hands-free reading.

TIME SPENT NAVIGATING CLUTTER & LOADING CHAPTERS
(RELATIVE INDEX)

95 → 9

-91%

200+

novels imported and organised from a single library export

10,000+

chapters scraped, formatted and made available offline

-80%

less time spent on ads and page loads before reaching a chapter

3

ways to organize your library for easier storage

Data analytics

Most companies already have the **data they need**. They are spread across systems that do not talk to each other, so answering a simple question means deriving it from the ground up. We ensure that you are in complete control of your company.

DCAS

PKNVD

Enterprise Omnichannel Media & Social Analytics Platform

Enterprise Real-Time Website Analysis Dashboard

HOW WE HELP

- 01 Get data out of the systems it is stuck in, and clean it up
- 02 One dashboard for the numbers you check daily, built around your questions
- 03 Reports that build themselves instead of someone assembling them every Monday
- 04 Match records across systems that spell the same customer four different ways
- 05 Forecasting and early warnings where the data actually supports them
- 06 Checks that flag a wrong number before anyone makes a decision on it

DCAS

Data correlation and entity resolution

DATA INTELLIGENCE AND ANALYTICS — NAME WITHHELD · 2026 · 6 WEEKS · DELIVERED

THE PROBLEM

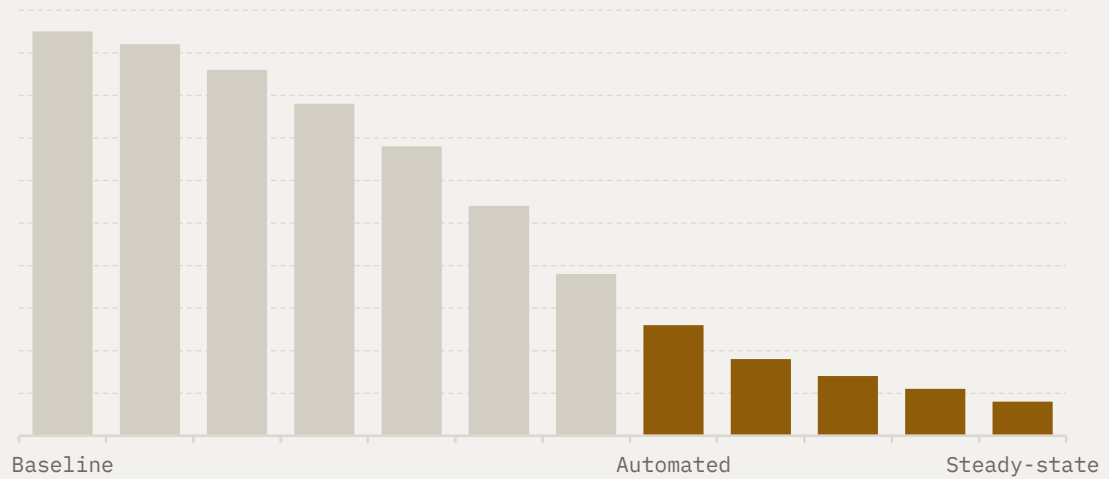

Analysts and intelligence teams routinely work against fragmented data silos: internal databases, customer registries, transaction logs, external communication records. Each dataset follows different schema conventions, lacks standardised formatting — inconsistent phone numbers, partial names, typos, alias variations — and runs to millions of rows.

WHAT CHANGED

Days of manual spreadsheet lookups and brittle one-off scripts collapsed into an automated correlation workflow with visible progress. Analysts can watch a run resolve linkages across massive datasets in real time, then export verified match clusters and audit-ready reports directly to stakeholders.

CROSS-DATABASE RECORD LINKAGE PROCESSING TIME (HOURS)

95 → 8 **-92%**

99.8%

entity resolution precision across dirty and unstructured records

10x

faster cross-database correlation than manual spreadsheet lookups

0 sec

UI freeze during multi-million record runs, via streamed progress

PKNVD

National vulnerability database

PUBLIC SECTOR CYBERSECURITY — NAME WITHHELD · 2026 · 9 WEEKS
· DELIVERED

THE PROBLEM

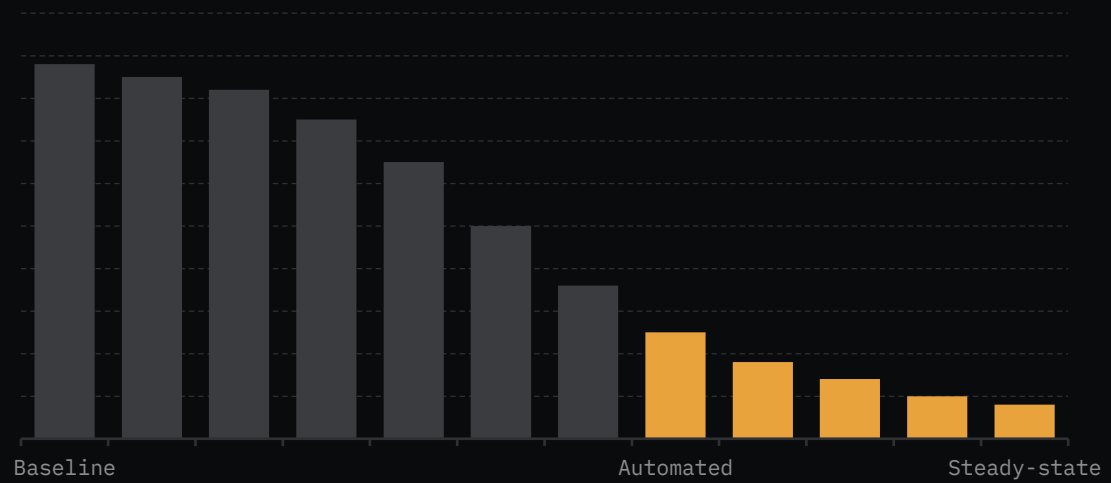

Security teams and national CERTs face thousands of new CVEs every month. Relying on base CVSS severity alone leaves analysts in the dark: a theoretical CVSS 9.8 flaw with no known exploit monopolises an emergency patching cycle while an actively weaponised CVSS 7.5 vulnerability goes unnoticed.

WHAT CHANGED

Security teams can isolate the vulnerabilities that have working public exploit code in a single click, rather than reconstructing that picture across several browser tabs. Contextual severity scoring — exploited in the wild, not merely theoretically severe — is what changes patch prioritisation, and it is now the default view rather than a manual research task.

VULNERABILITY ADVISORY TRIAGE TIME (MINUTES)

88 → 8 **-91%**

200,000+

CVE records indexed and cross-referenced with exploit registries

< 50ms

multi-facet query response across the full vulnerability catalogue

100%

automated weaponisation tracking across CISA KEV and public exploit sources

Enterprise Omnichannel Media & Social Social Analytics Platform

DIGITAL MEDIA, PUBLISHING & BROADCAST TELECOMMUNICATIONS – NAME
WITHHELD • 2025 • 9 WEEKS • DELIVERED

THE PROBLEM

High-volume digital publishing networks and regional broadcasting outlets distribute hundreds of news stories daily across a sprawling network of digital channels, including X (Twitter), Facebook, YouTube, Instagram, TikTok, Threads, WhatsApp Channels, and web portals.

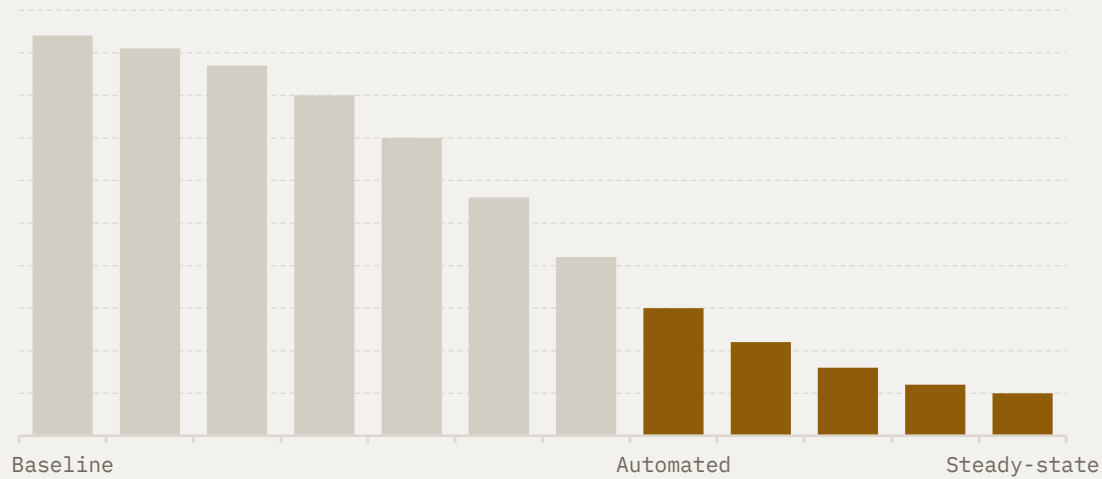

WHAT CHANGED

Editorial and marketing teams eliminated manual spreadsheet consolidation, collapsing a recurring multi-hour reporting chore into a live view they can open on demand. The unified eight-channel dashboard gives newsroom directors instant visibility into audience engagement dynamics, enabling immediate editorial pivots, content amplification, and clear cross-network performance benchmarking.

WEEKLY MANUAL REPORTING & CONSOLIDATION EFFORT
(HOURS)

94 → 10

-89%

90%

reduction in weekly manual reporting and CSV consolidation overhead

<300ms

query execution time for multi-year aggregated cross-platform analytics

8 Channels

unified into a single real-time executive dashboard

2 Languages

native bilingual support (English & Urdu) across editorial workflows

Enterprise Real-Time Website Analysis Analysis Dashboard

OPEN-SOURCE INTELLIGENCE (OSINT) & CYBERSECURITY ANALYTICS — NAME
WITHHELD · 2024 · 6 WEEKS · DELIVERED

THE PROBLEM

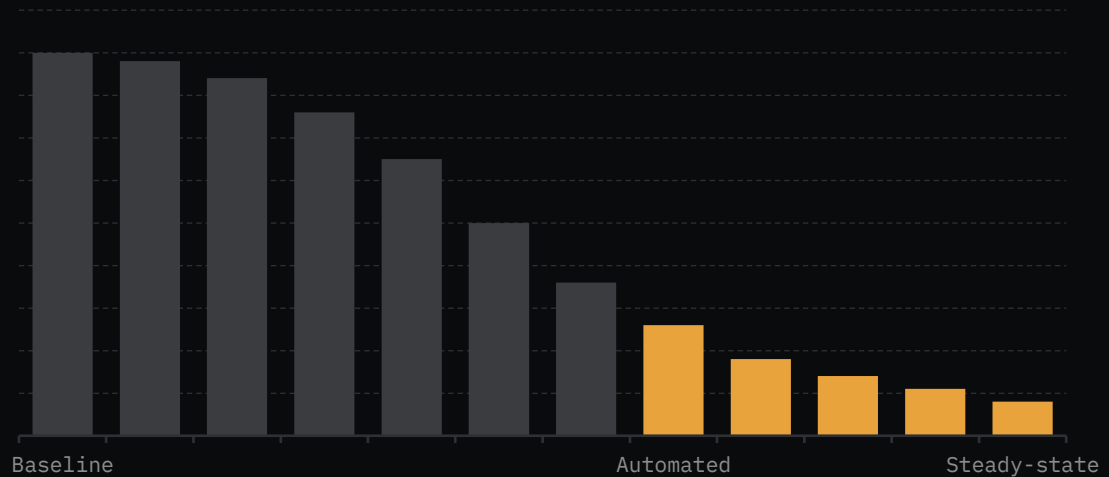

Cybersecurity analysts, OSINT researchers, and digital intelligence teams routinely audit target domains to evaluate infrastructure footprints, traffic patterns, hosting jurisdictions, and visual website configurations. Historically, investigators were forced to switch between 4–5 disconnected utilities to compile WHOIS ownership records, monthly visitor volumes, bounce rates, server geolocation, and responsive layouts.

WHAT CHANGED

Analysts consolidated multi-step manual lookup routines into a single three-second query workflow, eliminating tool sprawl and accelerating domain risk evaluations. The unified dashboard provides complete multi-device layout visibility without local browser exposure, while sub-second page transitions and concurrent rendering provide the responsiveness required for fast-paced digital intelligence operations.

DOMAIN AUDIT & OSINT COMPILATION TURNAROUND
(MINUTES)

90 → 8 **-91%**

85%

reduction in domain audit and OSINT triage
turnaround time

<100ms

UI state transition and dashboard render
latency

100%

multi-device viewport inspection coverage
without local endpoint risk

5 to 1

tool consolidation into a single unified
intelligence console

Cyber security

Security is not something you add after the software is built. We build systems that keep sensitive information under control from the start. That includes **secure messaging** and collaboration platforms, endpoint protection, EDR and SIEM systems, threat intelligence, and offensive and defensive security testing. We help businesses control **who can access data**, detect when something goes wrong, investigate what happened, and test their defences before someone else does.

CASE STUDIES THAT FOLLOW

Bolter SIEM

Enterprise Cyber Complaint & Content Governance Dashboard

Threat Intelligence and Adversary Tracking Platform

Secure End-to-End Encrypted Company Chatbot

HOW WE HELP

01

Penetration testing of applications and infrastructure, with a report your team can act on

02

Find what you have exposed to the internet and forgotten about

03

Protect sensitive data with access controls, encryption, and secure communication systems

04

Secure employee endpoints and control what data can leave the organisation

05

Compliance and complaint systems with a full audit trail behind them

06

Review code and design for security problems before something ships

Bolter SIEM

SOC monitoring and UEBA analytics

IN-HOUSE PRODUCT · 2025 · 8 MONTHS · DELIVERED

THE PROBLEM

Modern security operations centres are buried under millions of event logs from firewalls, Windows event logs, Linux syslogs and endpoint agents. Traditional SIEM interfaces lag under that volume, suffer severe alert fatigue, and lack coherent entity resolution — often conflating service accounts and high-traffic file servers with rogue human behaviour in UEBA leaderboards.

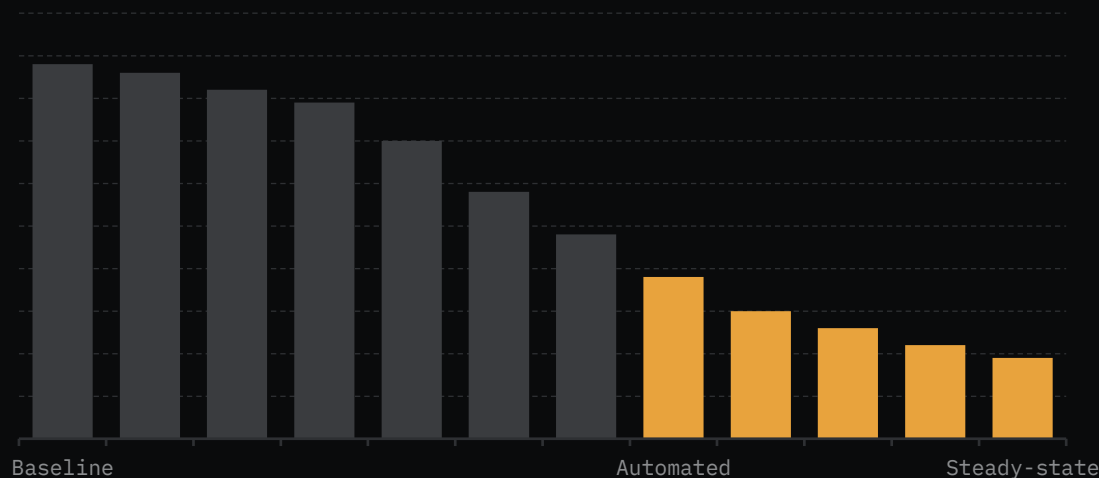

WHAT CHANGED

Analysts investigate roughly three times faster, working from zero-navigation forensic drawers and unified asset timelines rather than reassembling a device's history by hand across duplicate records. The segregated UEBA engine cut behavioural noise by about 40%, so responders spend their attention on genuine threats instead of benign automated workloads.

MEAN TIME TO INVESTIGATE INCIDENT (MINUTES)

88 → 19

-78%

1,000,000+

security events indexed and queryable per second

~65%

reduction in mean time to detect via live detection streams

100%

device identity unification across multi-agent telemetry sources

Enterprise Cyber Complaint & Content Governance Dashboard

TELECOMMUNICATIONS & CYBER REGULATORY GOVERNANCE — NAME WITHHELD
2024 • 8 WEEKS • DELIVERED

THE PROBLEM

Regulatory compliance teams and cyber governance bodies handle high volumes of reported URLs, impersonation claims, hate speech, and unlawful digital content across major social media networks, including X/Twitter, Facebook, YouTube, TikTok, and Instagram. Previously, compliance teams relied on fragmented spreadsheets, manual status logging, and ad-hoc evidence retention.

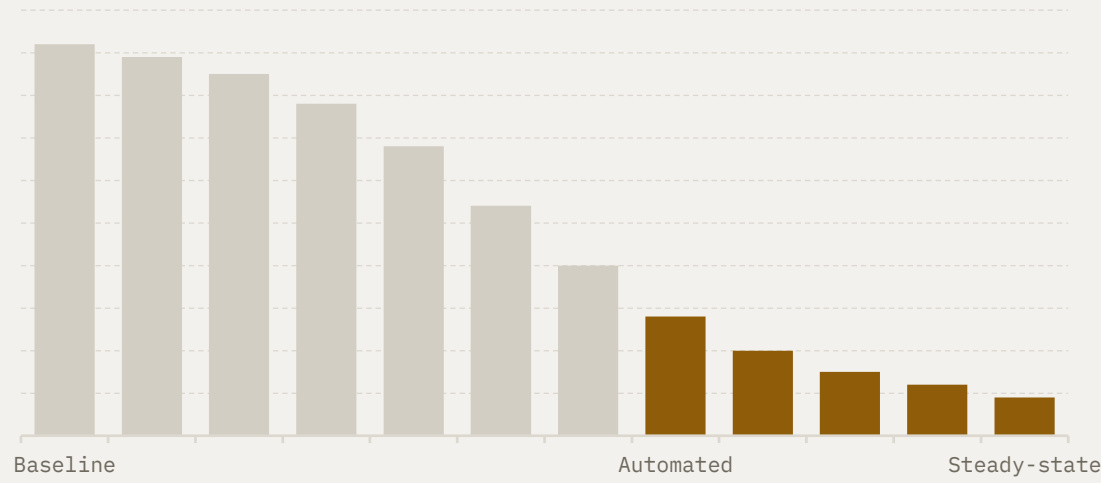

WHAT CHANGED

Regulatory analysts replaced disparate spreadsheets and manual handoffs with a unified, real-time command dashboard. Executive leadership gained instant transparency into platform compliance distributions, monthly enforcement velocity, and removed-reach metrics. The platform established an unbroken, tamper-proof evidentiary audit trail while providing fast analytical reporting and zero-downtime reliability for mission-critical regulatory monitoring.

COMPLAINT TURNAROUND TIME (HOURS)

92 → 9

-90%

90%

reduction in complaint processing and administrative turnaround time

100%

audit readiness and tamper-proof evidence archiving on Azure

1,095+

violating content items and accounts tracked and resolved

<1s

real-time alert latency across analyst consoles

Threat intelligence and adversary tracking tracking platform

CYBERSECURITY AND DEFENCE — NAME WITHHELD · 2025 · 8 MONTHS · DELIVERED

THE PROBLEM

Enterprise security operations centres and threat hunting teams are inundated with disconnected feeds of IP addresses, domain names, file hashes and malware signatures. Manually pulling from dozens of open-source and proprietary threat lists leaves analysts drowning in false positives and stale data, with no automated way to connect an isolated malicious IP to an active threat actor campaign, a known malware family, or the MITRE ATT&CK techniques being leveraged.

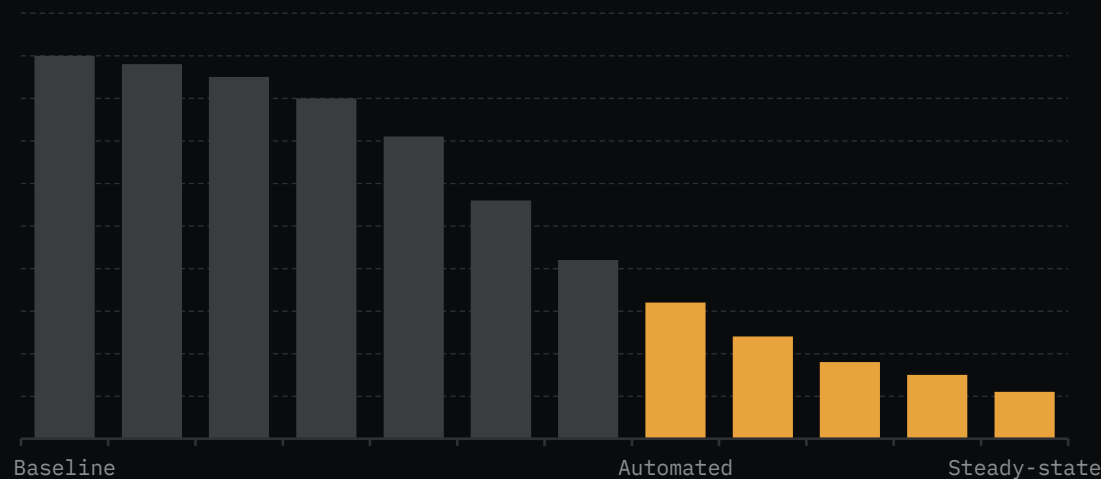

WHAT CHANGED

Raw, noisy threat feeds became an organised, actionable intelligence hub. Analysts replaced hours of manual indicator cross-referencing with automated risk scoring and instant campaign context, cutting triage time sharply. Security teams gain immediate visibility into global adversary activity, high-risk emerging indicators and relevant countermeasures from a single high-density command centre rather than a dozen browser tabs.

INDICATOR TRIAGE & CORRELATION LATENCY (MINUTES)

90 → 11

-88%

80+

OSINT, STIX/TAXII and commercial feeds ingested automatically

50,000+

indicators of compromise normalised and scored every day

3D

geospatial command centre for real-time adversary tracking

Secure End-to-End Encrypted Company Chatbot

PROFESSIONAL SERVICES — LOGMATE / DEVTROVE / SIGMA • 2026 • 3 MONTHS • DELIVERED

THE PROBLEM

Company knowledge was spread across shared drives, email threads, wikis, chat history and file servers, in every format from scanned PDFs to recorded training videos. Staff lost hours searching or asking colleagues, and new hires took months to learn where things lived. Public AI assistants were ruled out: sending confidential files to an outside model broke data policy, and none of them could respect who is allowed to see what.

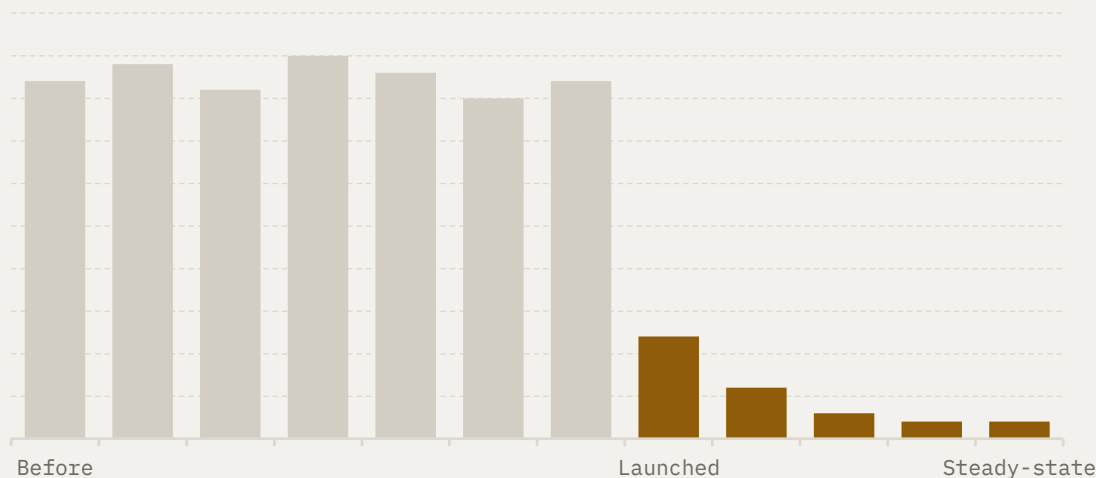

WHAT CHANGED

Every document, image, video and PDF now sits in one encrypted company brain that staff question in plain language. Conversations are encrypted end to end, and role-based access is checked before any answer is written, so an analyst and a director asking the same question each get an answer drawn only from what they are cleared to see. Every answer cites its source files, and every query is logged for audit.

TIME TO FIND AN INTERNAL ANSWER (MINUTES)

42 → 2

-95%

400K+

documents, images, videos and PDFs indexed and searchable

5

access tiers checked on every question before an answer is drawn

E2E

encryption from the employee's device to the knowledge store

In our clients' words

CURRENT BY LOGMATE

“This product has effectively reduced our workload by three quarters.”

DIRECTOR, LOGMATE

ENTERPRISE CYBER COMPLAINT & CONTENT GOVERNANCE DASHBOARD

“Boltertech delivered an enterprise platform that transformed our compliance monitoring capabilities. The combination of real-time data data visualizations, cloud evidence storage, and automated reporting has reporting has given our team unprecedented control and clarity over digital over digital content governance.”

Hasib Ahmad

TEAM LEAD, DEVTROVE

ENTERPRISE OMNICHANNEL MEDIA & SOCIAL ANALYTICS PLATFORM

“Bolter Tech delivered a tailored solution that completely transformed how transformed how our newsroom and marketing teams track audience audience engagement. Having our 8 major channels reporting real-time real-time metrics in a single, high-speed dashboard has significantly significantly improved our decision-making speed.”

Fayyaz Siddiqui

MEDIA NETWORK DIRECTOR, CSCCC

ENTERPRISE REAL-TIME WEBSITE ANALYSIS DASHBOARD

“BolterTech transformed our website evaluation workflow into a seamless, single-pane-of-glass dashboard. Their expertise in modern React architectures and intuitive SOC design made this project an outstanding success.”

Asif Usman

LEAD SECURITY & OSINT ANALYST, TENBYTES

How we work

PROJECT COST ESTIMATOR

Know what you're building before you build it.

Explore the features you need and get an early view of scope, timeline and cost. Indicative, not a quote.

[OPEN ESTIMATOR →](#)

01

Discovery

We start by understanding what you need the software to do and how the work happens today. We define the features, scope, requirements, and technical approach before we start. Use our website's **cost estimator** to work through your requirements and get a clearer picture of what you need.

02

Plan & Scope

We turn the requirements into a clear plan with defined deliverables, timelines, and pricing. For phased projects, each phase has an **agreed scope and cost, with assumptions and uncertainties made clear from the start.**

03

Build & Deliver

We build the solution in practical stages and **show you working progress** along the way. You stay involved throughout the process, so feedback can be addressed early rather than waiting until everything is finished.

04

Handover & Support Support

Once the project is delivered, we provide the **necessary documentation, access, and handover** so your team can use and manage the solution confidently. If you need ongoing maintenance, improvements, automation, analytics, or technical support, we can continue through an ongoing support arrangement.

How you can engage us

START YOUR JOURNEY HERE

Discovery & Planning Planning

Not sure where to start, or have an idea that needs to be shaped into a practical solution? We work with you to understand the problem, define what needs to be built, identify the right technology and approach, and create a clear plan for execution. This is ideal for larger or more complex projects where getting the direction right before development can save time and cost.

TERMS

Typically 1–2 weeks, priced according to project requirements.

MOST COMMON

Build & Deliver

From a small task that simply needs to get done to a complete software, AI automation, or data analytics solution, we build what your business needs and take it through to delivery. We work in clear phases with defined deliverables, keeping you involved throughout development while handling the technical work from start to finish. This is the right fit when you have a project that needs to be built, improved, automated, or brought to life.

TERMS

Priced per project, with larger engagements structured into clear delivery phases.

AFTER LAUNCH

Ongoing Support

Some solutions need more than a one-time delivery. We stay involved to maintain, improve, monitor, automate, and support your digital systems over time, whether that means ongoing software development, AI automation, data analytics, digital marketing, or operational support. This is ideal for businesses that need a reliable technology partner without building a full in-house team.

TERMS

Monthly retainer, with scope and support level agreed based on ongoing requirements.

What we commit to in writing

01

A dedicated point of contact

You will have a clear point of contact throughout the project who understands your requirements, decisions, and progress. You will always know who to speak to when you have a question, need an update, or want to make a decision.

02

Clear pricing by phase

Before each phase begins, you will know what we are delivering, what it will cost, and what assumptions the price is based on. If a change affects the scope, timeline, or cost, we will discuss and agree it with you before carrying out the additional work.

03

You own what we build

The software, designs, documentation, and project deliverables created specifically for you belong to you, subject to the terms agreed in your contract. We will provide the access and documentation you need to operate, maintain, and continue developing your solution.

04

Support beyond delivery

Our involvement does not have to end when the project goes live. We provide a proper handover and can continue supporting, maintaining, improving, and expanding your solution through an ongoing support arrangement when your business needs it, with 3 months of guaranteed support.

Questions we get asked

Who owns the code and the intellectual property?

You do, on final payment, in full. That includes the source, the infrastructure definitions, and the documentation. We keep no licence over your systems and we do not reuse client code in other engagements.

How do you scope and price a project?

We start with a conversation to understand what you need, how the work is done today, and what the project needs to achieve. We then turn that into a written scope with clear deliverables, timelines, assumptions, and pricing, with larger projects broken into defined phases. If something changes along the way, we discuss the impact on scope, timeline, and cost before doing the additional work, so there are no unexpected charges.

Can you work with our existing systems, or do we need to start from scratch?

We can work with what you already have. Whether you need to improve an existing application, connect different systems, automate a manual process, add AI capabilities, or build something completely new, we first assess your current setup and recommend the most practical approach. We do not rebuild something from scratch simply because it is easier for us.

What timezone overlap do we actually get?

We operate in UTC+5. That is a full working morning overlapping Europe and an afternoon overlapping the US East Coast. We commit to a fixed daily overlap window in writing before a project starts rather than leaving it to chance.

Do you use AI to write our code, and will you tell us?

Yes, we use AI tools where they can improve speed, research, testing, documentation, and development efficiency. AI-generated work is reviewed, tested, and validated by our engineers before it becomes part of your solution, and we remain responsible for the quality, security, and functionality of what we deliver. If AI is used in a material part of your project, we will be transparent about how it is being used and what human review is applied.

What if our needs change during the project?

We plan in phases and communicate regularly, so changes can be discussed and incorporated as we go. If something new is needed, we will clarify the impact on scope, timeline, and cost before proceeding.

Start a project

Tell us what is slowing your team down, and let's get started
